

Hexagon Coloring

Problem

If you haven't already done so, do [Pascal's Triangle](#) and [Pascal's Trinagle Coloring](#) problems first.

This hexagon is made by taking six copies of Pascal's Triangle, and then connecting them along the diagonals containing ones. As you did in [Pascal's Trinagle Coloring](#), color all the small hexagons containing an odd number one color, and all the small hexagons containing an even number another color.
